

We create two new projects in jenkins which contains build and deploy our code.

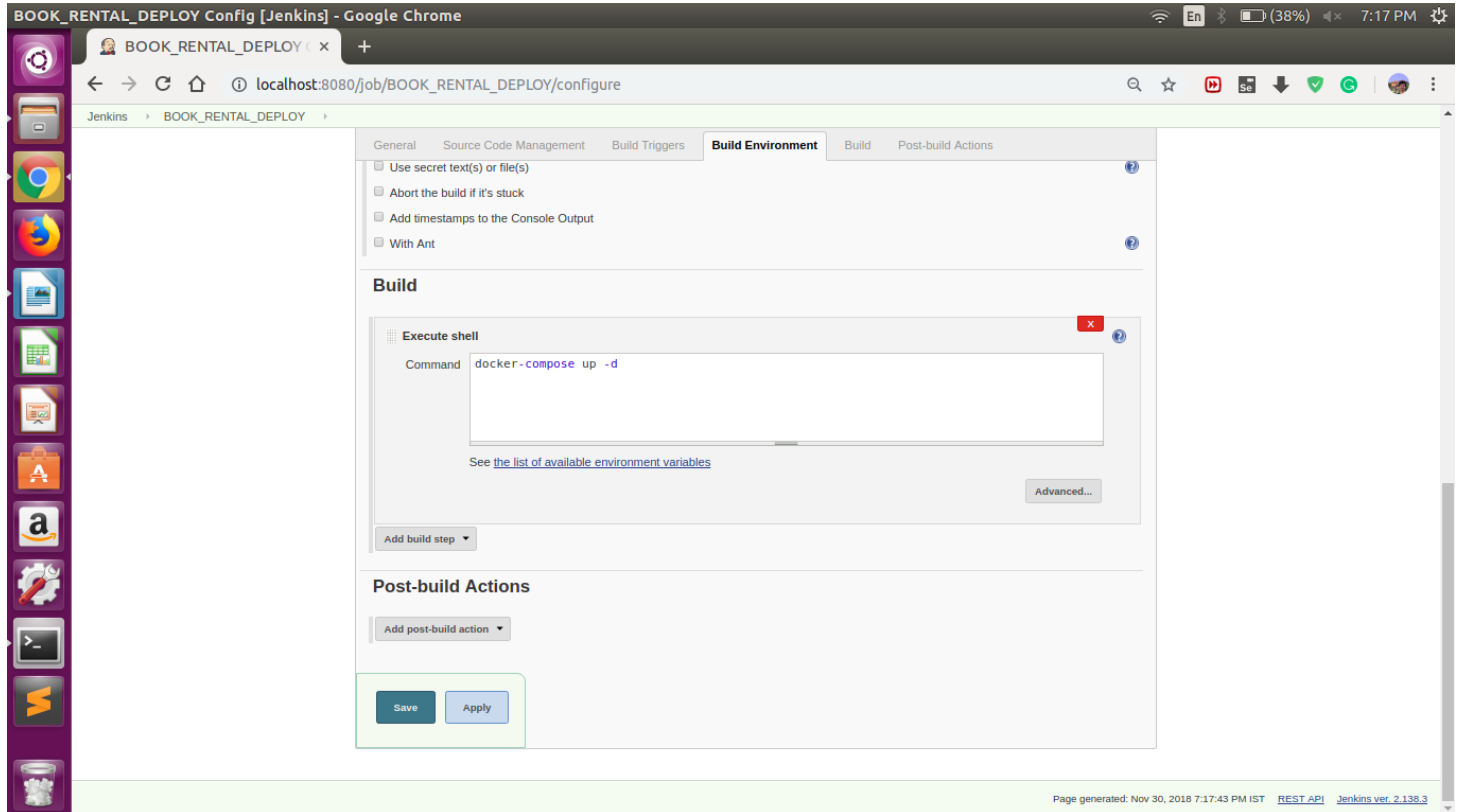

In “BOOK_RENTAL_BUILD” ,we integrate our project with github by giving our github credentials to jenkins and repository which contains our files.

In post build actions we select “build another projects” and add “BOOK_RENTAL_DEPLOY” ,this means after collecting our code from github we ask jenkins to run this post build action.

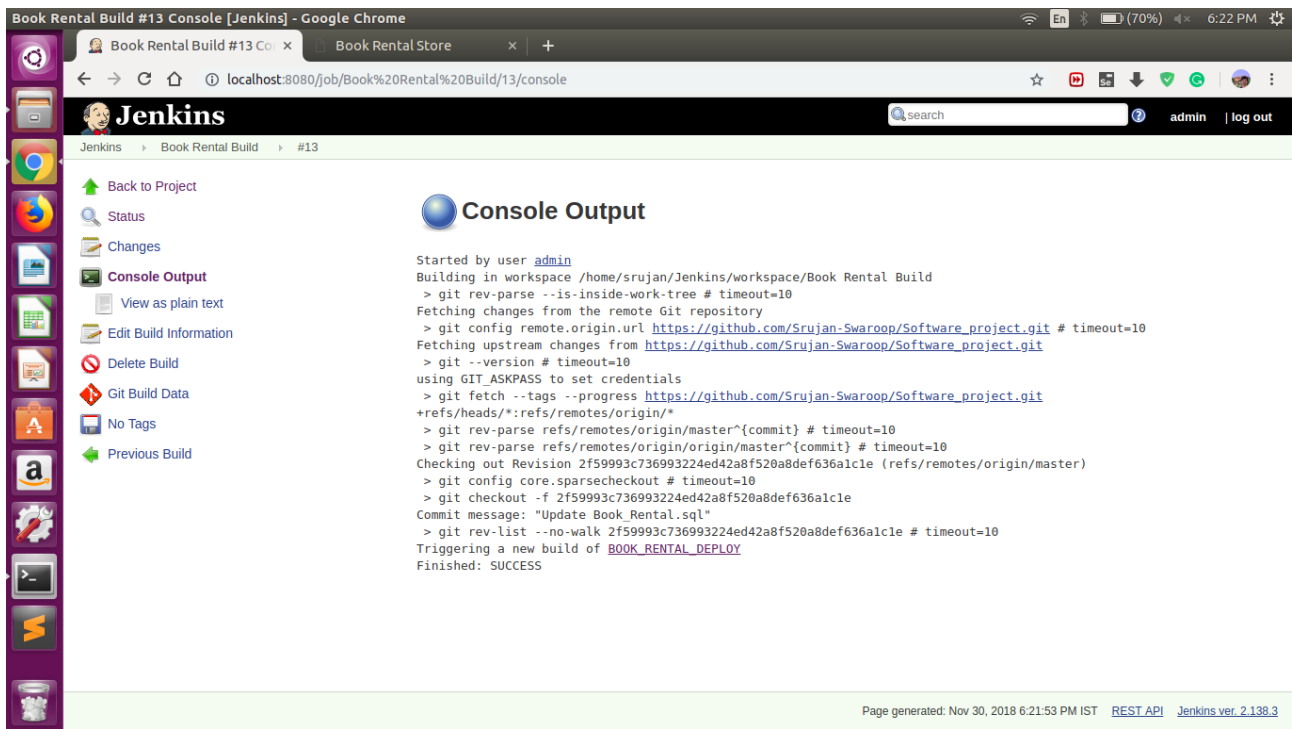

In “BOOK_RENTAL_DEPLOY” ,we ask to execute docker files using the command we given in execute shell.

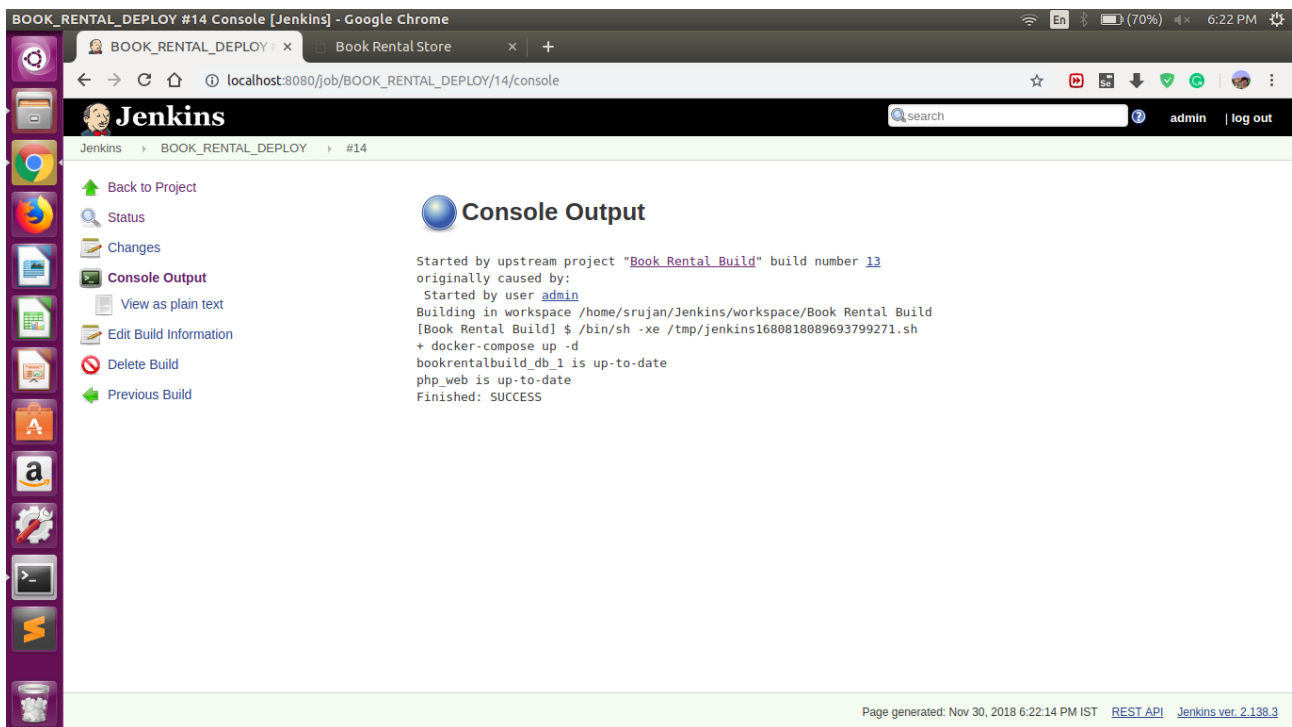

So these are the outputs of both the projects.

For BUILD :

For DEPLOY :

So,after deploying we can access website using
“<http://localhost:8100/>”
